Assignment #2

- Create code in Python to output sensor data
  - Use built-in open(filename, 'w') & truncate() methods to open and clear the HTML file
  - Leverage Python's concatenation or """" multiline string syntax
    - can use substitution - .format()
  - Code should output into a HTML file
  - The HTML file should be accessible from any other device capable of displaying a web page
  - HTML page should also contain:
    - Name of your device
    - Runtime - Time & Date stamp in local time format
    - A table with sensor name and value from sensor.
  - Extra credit: enhance the display using colors, JavaScript, and CSS. Use crontab to schedule your program as a task
